

I believe in human capability. When we are under pressure, humans can show an impressive amount of talent in many different areas of life. That includes hardships, technological advances, caring and compassion, etc.

My mother never had an easy time, having her first child at 21 and a second soon after. She became a single mother when I was four so she did the only thing she could, she got a job in a daycare. That way she could pay our bills and afford for us to be taken care of while she worked. Although we didn't have much, she always made sure we had what we needed and many things we wanted. It wasn't easy, and probably wasn't fun, but she found the strength to come through anyways.

This thought can be translated to many aspects of society through any hardship we face together. Saving our environment to save ourselves will soon be a priority even to those who don't consider it one now, and I fully believe we are capable of making the necessary changes. Not that the environment is completely collapsing or anything, but it should be obvious that we (nor any other species, like invasive animals) can continue to abuse it without any consequences.

I believe evolution is how we all got where we are today, meaning a god didn't just magically make everything on earth fit together perfectly. Everything fits together perfectly because it took an extremely long time to balance this delicate system. As we have seen in the past with natural environmental shifts, when the system gets out of sync the whole world literally transforms into a new planet that has a different, but also balanced system. Human society will realize this fully one day and put itself under the great pressure of trying to prevent an environmental shift and save our only habitat.

The day the human race seriously accepts this pressure and responsibility is the day a new world of advances truly opens up. If in two hundred years we can go from pushing a horse and buggy to deliver mail over a period of months to driving cars, flying airplanes over oceans in hours, and delivering mail all over the world in a single instant with computers, then we can surely accomplish many things we aren't yet aware of and probably couldn't even imagine.
